Diagnosis

- Lymphedema (chronic)
- Swelling (acute)
- Chronic Venous Insufficiency
- Combined Lymphedema
- Lipedema
- _____

Area Affected

- Right Arm Left Arm
- Right Leg Left Leg
- Right Foot Left Foot
- Other _____
- _____

Treatment

- TributeNight (20-30mmHg) → → → + Outer Jacket (+10mmHg)
- ReadyWrap + Variable Compression Jacket
- Caresia + Modifications as necessary
- ExoSoft Round Knit
- ExoStrong Flat Knit
- CCL1 CCL2 CCL3

PHYSICIAN'S PRODUCT GUIDE L&R USA SOLARIS COLLECTION

TRIBUTE^{Night}™ PREMIUM, CUSTOM-MADE NIGHTTIME COMPRESSION

TributeNight is a custom-made therapeutic garment designed to be worn at night as a more consistent and effective alternative to nighttime bandaging. Quilted, directional channels sewn into the fabric are filled with medical-grade foam particles which provide tissue stretch, stimulate the lymphatics and break down fibrosis. The channels guide fluid to areas rich in potential for the formation of collateral pathways. The material is breathable, lightweight, and thermo-releasing, with anti-microbial properties to keep skin cool, dry and clean. Can be designed for application over any affected area of the body.

- Compression:** Gradient 20-30mmHg
- Indications:** Chronic edema of any kind. Wounds must be dressed.
- Contraindications:** Include but are not limited to: arterial insufficiency, untreated CHF, obstructive edema, deep vein thrombosis, active infection, absence of sensation, any condition where increased fluid return is a concern.

TRIBUTE^{Night}™ OUTER JACKETS, VARIABLE COMPRESSION JACKETS

Outer Jackets are simple, mildly compressive sleeves worn over TributeNight garments.
Compression: Adds apx. 10mmHg bringing overall compression to approx 30-40mmHg
Variable Compression Jackets: custom-made of strong, low-stretch, Velcro®-receptive material with an overlapping, adjustable tabbed closure system. Compression is set in consultation with the treating clinician to provide customized compression and accommodate volume fluctuations, particularly reductions.

READYWRAP™ LOW-STRETCH BINDERS

ReadyWrap is a medical compression binder of low elasticity and is especially valuable when swelling is aggressive or the venous and/or lymphatic system requires support, or for patients who cannot tolerate or manage traditional, elastic compression garments. ReadyWrap's unique design and Velcro™ donning mechanism allows for adjustability to accommodate mild fluctuations. Suitable for application over dressed wounds
Compression: Variable compression; therapeutic ranges (20-50 mmHg)
Indications/Contraindications: Same as for Tribute, above.

CAREZIA™ COMPRESSION BANDAGING LINER GARMENTS

Caresia's construction features quilted, directional channels filled with medical grade foam chips as found in the TributeNight. Caresia is available in a range of standard styles and sizes, and compression is applied and customized by the patient and/or their therapist with an overwrap of short-stretch bandaging. Caresia is extremely useful in both clinical treatment and home-care phases of therapy and for addressing any acute edema, particularly where fibrosis is present.

- Compression:** Variable compression; therapeutic ranges (20-50 mmHg)
- Indications/Contraindications:** Same as for Tribute, above.

EXOSOFT™, EXOSTRONG™ DAYTIME KNIT COMPRESSION

ExoSoft standard sized circular knit and ExoStrong ready-to-wear and custom flat-knit garments in class 1, 2 and 3 for arms and legs.
Compression: Variable compression; therapeutic ranges (20-50 mmHg)
Indications/Contraindications: Same as for Tribute, above.
